Draw an Owl on a Grid

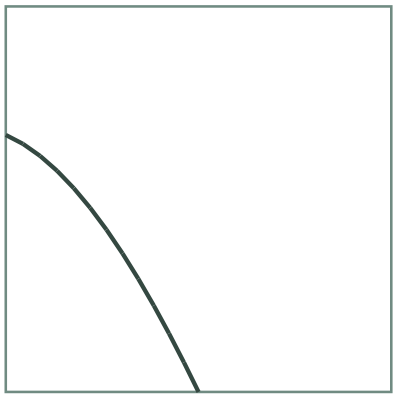
Reference I Worked example I LETTER

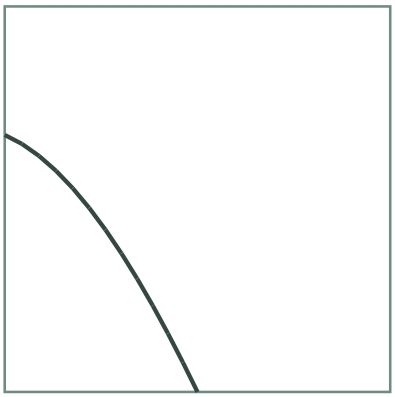
Original prompt

Copy the owl's head-top curve from reference square row 2, column 3 into the matching blank square.

Reference square



Model copy



Answer

In the blank grid, mark the entry point one-third down the left edge of row 2, column 3, and the exit point halfway across its bottom edge. Draw a smooth curve joining them, matching the reference curve's direction.

Reasoning

Grid copying works by matching where lines cross each square's edges. Copying the entry and exit points first fixes the curve's position, and the smooth join reproduces its shape.

Check

Hold the reference and your copy side by side. The curve should start and end at the same relative points on the same edges, and should continue smoothly into the neighbouring squares.
