Castle Perspective Drawing

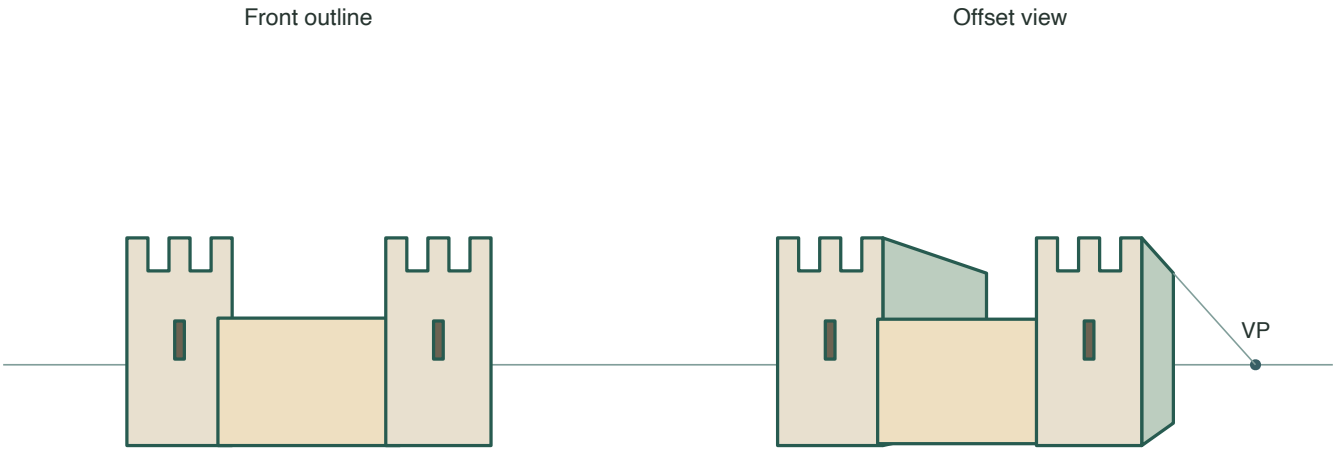
Reference I Worked comparison I LETTER

Original prompt

Worked example: draw a front view and an angled view of one simple castle on a shared horizon.



Answer

Front view: horizon and vanishing point marked; rectangular main wall with level top/bottom edges; two upright boxes with flat crenellated tops, equal in the chosen drawing; no side wall. Side-revealing view: same horizon and point; front wall remains horizontal/vertical; the right side wall is visible; only its depth edges meet the point; keep both towers upright and the same chosen size.

Reasoning

The second drawing shifts the viewpoint but does not rotate the castle or camera direction. The front wall stays parallel to the page, so its edges remain horizontal and vertical. The visible side wall runs into depth and its parallel depth edges converge to the shared point. Tower size is not used as a depth cue in this comparison.

Check

Use the page edge for verticals and the horizon for front-wall horizontals. Test only side-wall depth edges against the vanishing point; check that the same right side is shown and that both towers remain upright and equal in the chosen drawing.
