# Printable Ruled Notebook Paper With Margin and Binder-Hole Guides

Worked example / complete source key

A binder has ring centers 19 mm apart and holes 6 mm in diameter, with hole centers 12 mm from the left edge. A printed page shows guide circles at 20 mm spacing and 10 mm from the edge. What should be checked before punching?

Answer: The printed guides do not match the measured binder: spacing differs by 1 mm and edge distance by 2 mm. Adjust the guide positions in the source file to the measured values, reprint, and confirm alignment before punching. These numbers are hypothetical and describe one binder only.

Reason: Guide circles are alignment aids, so they must match the actual binder measurements. A mismatch means punched holes would sit off the ring centers.

Check: After adjusting and reprinting, place the sheet against the binder rings and confirm each guide circle centers on a ring before punching.
