Foldable Booklet and Drawing Worksheet Page Layout

Worked example / complete source key

A sheet measures 200 mm by 280 mm. You fold it in half along the short edge, then in half again. How many panels are on one side after unfolding, and what is the approximate panel width if the folds divide the width equally?

Answer: Four panels per side. The width is divided into two equal parts by the vertical fold, so each panel is about 100 mm wide. The height is also divided, but the question asks for width. Check by unfolding and counting four panels across the width.
