Dragon Wing Drawing: Bone Struts, Membrane Panels, and Folded vs Spread Forms

Original worked example / unchanged complete key

Prompt: A learner draws a spread wing with four struts and three membrane panels, then a folded wing with only two visible struts. They want to check whether the folded wing is structurally consistent.

Answer: The folded wing is consistent if the two hidden struts are shown with dashed lines behind membrane folds and the same three panel numbers appear. Count struts: four total, two visible, two dashed. Count panels: three, with the outer panels overlapping. If the learner measured a hypothetical 18 cm leading edge and 12 cm trailing span, the area check is 18 times 12 equals 216 square cm, labeled as a hypothetical example.
