Banana Cat Drawing: A Step-by-Step Hybrid Guide

Original worked example / unchanged complete key

Prompt: A student draws a banana body 12 cm long and 4 cm wide, then places a head circle 4 cm across one-third of the body length from the top. They attach four legs each 3 cm long. Check the proportions and hybrid reading.

Answer: The head diameter is 4 cm, which is one-third of the 12 cm body length, so the face proportion is correct. Each leg is 3 cm, one-quarter of the body length, which is also correct. The head center is placed 4 cm from the top end along the upper front curve, matching the one-third rule. Hybrid reading is clear if the head circle overlaps the body and all four paws align on a ground line. If the head floats above the body, move its center down so the head circle overlaps the body by about one-quarter of the head diameter (about 1 cm for a 4 cm head).
