Banquo Figure Drawing: Costume and Stance Construction

Original worked example / unchanged complete key

Prompt: A student draws a Banquo figure on a sheet where the head height is 3 cm. They mark eight head heights vertically. What is the total figure height in centimeters, and where should the waist mark fall if it is placed at four head heights from the crown?

Answer: Total height is 8 × 3 cm = 24 cm. The waist mark is 4 × 3 cm = 12 cm below the crown.

Reason: Multiply the head height by the number of units to get total height. Multiply the head height by the waist unit number to get the waist position from the crown. Keep units in centimeters throughout.

Check: Measure the drawn distance from crown to foot mark and confirm it is 24 cm; measure from crown to waist mark and confirm it is 12 cm.
