Dragon Wings Drawing Reference: Bone Arm, Membrane Spans, Folded and Spread Poses

Original worked example / unchanged complete key

Prompt: A spread wing uses a 6 cm leading-edge strut, a 5 cm second strut, and a 4 cm third strut, with three membrane spans. The folded version shows the same three struts but the leading strut measures 8 cm. Identify the likely error and state a fix.

Answer: The leading strut grew by 2 cm, which exceeds the 1 cm tolerance on a 6 cm example, so the folded frame was probably redrawn rather than rotated. Fix by copying the 6 cm leading strut from the spread drawing, then rotating it into the folded angle without changing its length. Recheck that three spans remain visible.
