Draw a Housefly: Segmented Body, Six Legs, and Wing Veins

Original worked example / unchanged complete key

Prompt: A student draws a housefly with a head oval 2 cm wide, a thorax oval 3 cm wide, and an abdomen oval 4 cm long. They draw five legs and two wings with three veins each. Identify what is correct and what must be fixed.

Answer: Correct: three body segments in the right order, thorax wider than head, two wings with countable veins. Fix: add one more leg so there are six, and confirm all legs attach to the thorax. The abdomen length is acceptable because it is longer than the head but narrower than the thorax.
