Femboy Pose Drawing: Posture and Limb Placement Variants

Original worked example / unchanged complete key

Prompt: Construct a relaxed femboy pose using variant two: one hand on hip, weight on one leg. Use a hypothetical x-height of two grid squares and a torso length of six grid squares. Describe the landmarks and one check.

Answer: Mark the foot baseline and place the supporting foot under the hip center. Draw the torso axis tilted about five degrees from vertical, with one shoulder dropped. Mark the head midline and head baseline two grid squares apart. Draw the torso from hip center to shoulder line as six grid squares, so the torso is three x-heights. Bend one elbow so the hand rests near the hip, and shift the hip center slightly over the supporting foot. Check: a vertical line from hip center should cross near the supporting ankle, and the posture word relaxed should still read after construction marks are lightened.
