Animal Contour Drawing: Blind Contour and Edge Tracing Practice

Original worked example / unchanged complete key

Prompt: A learner draws a rabbit outline from the nose, around the ears, down the back, and to the tail. They lift the pencil once near the ear and once at the tail. The start arrow is at the nose and the stop arrow is at the tail. The learner marks a baseline and a midline on their own paper and measures the ear height as about 4 centimeters from baseline to midline, labeling it a hypothetical example. Count the breaks and state one check.

Answer: There are two breaks: one near the ear and one at the tail. The line is not fully continuous. Check: the start and stop points match the arrows, but the pencil lifted twice. Next attempt should return to the last correct point instead of lifting.
