Draw Two Reaching Hand Poses: Block-In, Proportion, and Annotation

Original worked example / unchanged complete key

Prompt: A learner blocks a pointing hand with a palm width of 3 units and an index finger length of 4 units. They then measure the drawn index finger as 5 units. Is the drawing within the planned proportion, and what adjustment is needed?

Answer: The planned ratio is index finger length equal to 4 units when palm width is 3 units. The drawn finger is 5 units, which is 1 unit too long. Shorten the index finger by 1 unit, or about one quarter of its drawn length, and recheck against the knuckle line before contouring.
