Cross-Contour Face Drawing: Surface Lines for Cheek, Nose, and Brow

Original worked example / unchanged complete key

Prompt: On a 15 cm face outline, draw one cheek line, one nose line, and one brow line using a hypothetical 8 mm spacing. Describe where each line turns.

Answer: The cheek line starts 3 cm from the outline near the ear, curves forward, and turns downward at the cheekbone about 5 cm along the line from its start. The nose line starts at the bridge, wraps around the nostril wing, and turns outward about 2 cm along the line from its start. The brow line starts above the eyebrow, follows the forehead curve, and turns slightly upward about 4 cm along the line from its start. Spacing between adjacent lines is about 8 mm. All distances and the 8 mm spacing are hypothetical example measurements, independent of the 15 cm outline width; measure your own reference before drawing.
