Cat Contour Drawing: Single-Line Outline and Blind-Contour Practice

Original worked example / unchanged complete key

Prompt: A simple cat outline faces left. The head is about two x-heights tall, the body about three x-heights long, and the tail about three x-heights long. Draw a single-line contour starting at the nose, going over the ears, along the back, around the tail, under the paws, and back to the chin. Keep the pencil down and allow no more than one crossing.

Answer: The line begins at the nose, rises over the forehead, points at the left ear, dips between the ears, points at the right ear, curves down the neck, follows the back to the tail base, sweeps around the tail tip, returns along the belly, bumps under the front paws, and ends at the chin. The silhouette reads as a cat; ears, tail, and paws are present. One crossing occurs near the tail base and is allowed. The proportions are hypothetical examples, not fixed standards.
