Draw an Upside-Down Umbrella: Canopy Down, Handle Up

Original worked example / unchanged complete key

Prompt: Describe how to draw an upside-down umbrella with a 10 cm canopy width, ribs pointing down, and a handle rising 8 cm above the canopy center. Use a baseline and midline.

Answer: Draw a baseline near the bottom and a midline above it. Mark the canopy center on the midline. Mark 5 cm left and 5 cm right of center for the rim width. Draw the lower rim arc so its lowest points are near the baseline. Draw an upper arc above it for thickness. Add six ribs from the center to the rim, tips pointing down. From the center, draw the handle upward 8 cm, crossing the midline, and add a small grip. Check: handle top is highest; rib tips are lowest; canopy center is above the rim.
