Female Figure Proportion Plate: Torso Landmarks and Practice

Original worked example / unchanged complete key

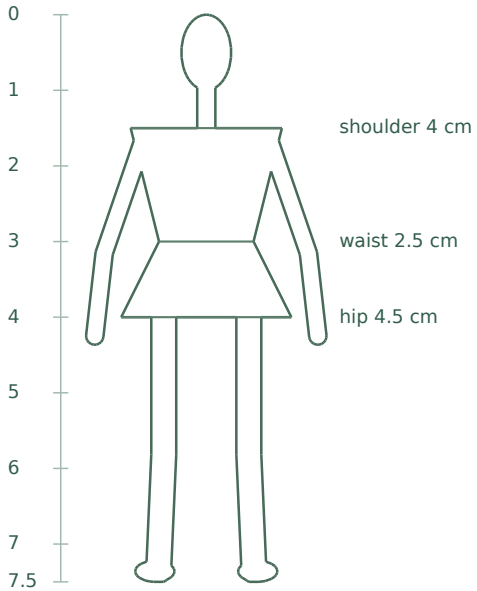

Prompt: A student draws a figure 15 cm tall and divides it into seven and a half head units. The shoulder width is 4.0 cm, waist width is 2.5 cm, and hip width is 4.5 cm. Check the proportions using the ratios described in the lesson.

Answer: Waist divided by shoulder is 2.5 divided by 4.0, which equals 0.625, less than one, so the waist is narrower than the shoulder. Hip divided by shoulder is 4.5 divided by 4.0, which equals 1.125, within the typical range of about 0.9 to 1.3. The proportions are consistent with the guide. The head unit height is 15 divided by 7.5, which equals 2.0 cm per head unit.

Worked reference / reference

Hypothetical figure guides / labelled lengths print 1:2 / widths are torso guides, not arm span

Head unit: 15 / 7.5 = 2 cm. Waist/shoulder = 0.625; hips/shoulder = 1.125. These meet this selected worksheet rule, not a biological standard.
