Tattoo Drawing Exercises: Line, Curve and Shading Drills

Original worked example / unchanged complete key

Prompt: Draw a set of four parallel lines with three equal gaps. The total width from the first line to the last is 30 mm. What should each gap measure, and how do you check it?

Answer: Each gap should measure 10 mm because 30 mm divided by three gaps equals 10 mm. Check by measuring each gap; if one gap is 12 mm and another is 8 mm, adjust the dots and redraw. This is a hypothetical example; use your own measurements.
