Tattoo Practice Plate: Linework, Shading, and Stencil Transfer Drills

Original worked example / unchanged complete key

Prompt: Draw a 6 cm horizontal line, then a 6 cm vertical line crossing it at the midpoint. Evaluate line width consistency and endpoint control.

Answer: The lines should be straight, equal in thickness, and cross at the midpoint. Endpoints should be clean with no hooks or fading. If the horizontal line is thicker at one end, reduce pressure there and repeat. If the vertical line wobbles, slow down and anchor your hand.

Reason: This example combines straight-line control with alignment. It is simple enough to check visually and isolates two key variables: width consistency and endpoint control.

Check: Use a ruler to confirm the 6 cm lengths and midpoint crossing. Compare line thickness at three points along each line. Mark any deviation and repeat once.
