How to Draw a Combusken Pixel Character on Graph Paper

Ordinary topic reference / separately checked pixels

Counted original pixel drawing / chosen cell sizes are labelled / not a game-sprite copy

12 columns / 16 rows / 5 mm cells

O orange: 70 Y yellow: 30 K black: 20

Original Combusken-inspired teaching design: 120 colored cells + 72 blank background cells = 192. Intentional tail asymmetry is recorded; do not add ink merely to fill the box.

How to Draw a Combusken Pixel Character on Graph Paper

Original worked example / unchanged complete key

Prompt: A student plans a 12-square-wide by 16-square-tall pixel character. The color key uses O for orange, Y for yellow, and K for black. After coloring, the student counts 70 orange squares, 30 yellow squares, and 20 black squares. The bounding box contains 192 squares. Check whether the color totals match the box and suggest one correction if they do not.

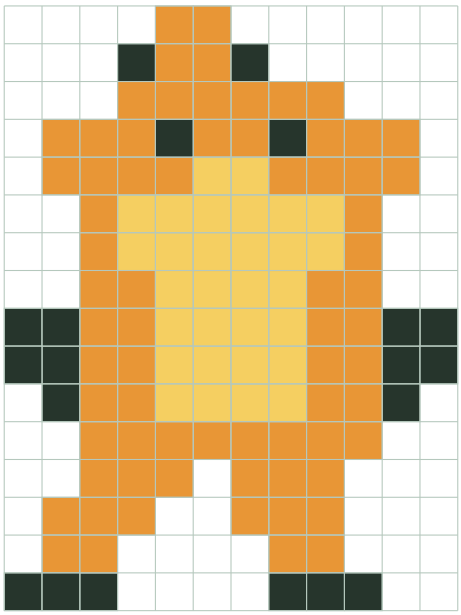

Answer: The color totals are 70 + 30 + 20 = 120 squares. The bounding box has 12 × 16 = 192 squares. The totals do not match; 72 squares are unaccounted for. One correction is to recount each color row by row and mark uncolored squares inside the box, then either color them according to the key or shrink the bounding box to the actual used area and relabel the dimensions. These 72 cells may include intended blank background; record background separately before calling every uncolored cell an error. If the plan requires every box cell to have a key symbol, give those cells their intended background or color symbols. Do not shrink a box unless its actual occupied extents allow that change.
