How to Draw a Snake Worksheet: Coil and Head Construction

Original worked example / unchanged complete key

Prompt: A student draws a coil with a widest gap of 2 cm and a head length of 3 cm. The head points away from the coil, but the neck has a sharp corner. Identify the main issue and give a correction.

Answer: The main issue is the sharp corner at the neck. The head length is within the suggested range (1 to 1.5 times the 2 cm gap), so the head size is acceptable. Redraw the neck so the outer coil edge flows smoothly into the back of the skull and the inner edge flows into the jaw.
